I started to put this presentation together two hours before I left for a one week vacation, and then I caught Enfluenza Type A+, which knocked me on my behind for most of a week, and then came here.

Hopefully this will all make sense...

# AGENDA: MUTUAL INDEPENDENCE OF SEED LOCATION AND SEED ENCOUNTER

Theorem:  $A'$  and  $B'$  are independent

$$A' \cap B' = (A \cup B)'$$

$$\boxed{P(A' \cap B')} = P[(A \cup B)']$$

$$\stackrel{AX}{=} 1 - P(A \cup B)$$

$$= 1 - [P(A) + P(B) - P(A \cap B)]$$

$$= 1 - P(A) - P(B) + P(A \cap B)$$

$$= (1 - P(A)) \cdot (1 - P(B))$$

$$\stackrel{AX}{=} \boxed{P(A') \cdot P(B')}$$

$\Rightarrow A'$  and  $B'$  are independent

## WHAT 'ENVIRONMENTAL DATA QUALITY' IS NOT:

At the count of three I will snap my fingers, you will resweep 10%, and the grid will be cleared!

# WHAT 'ENVIRONMENTAL DATA QUALITY' IS

Being able to say **this is what we achieved** with a **high degree of confidence**.

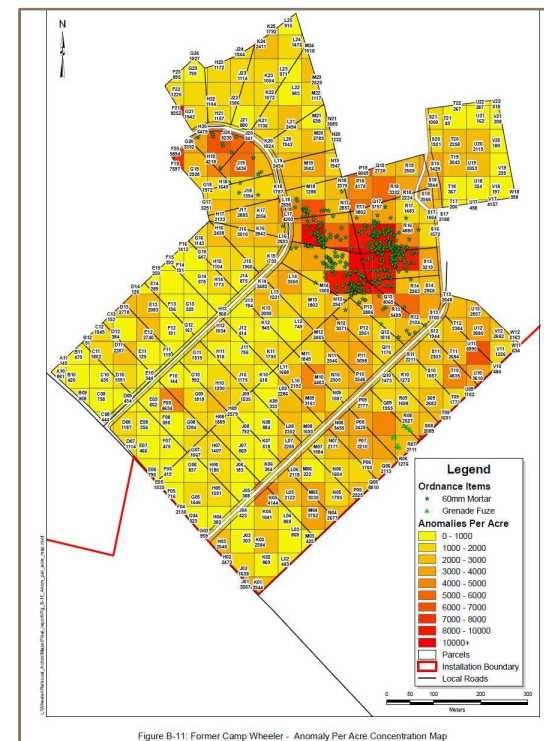

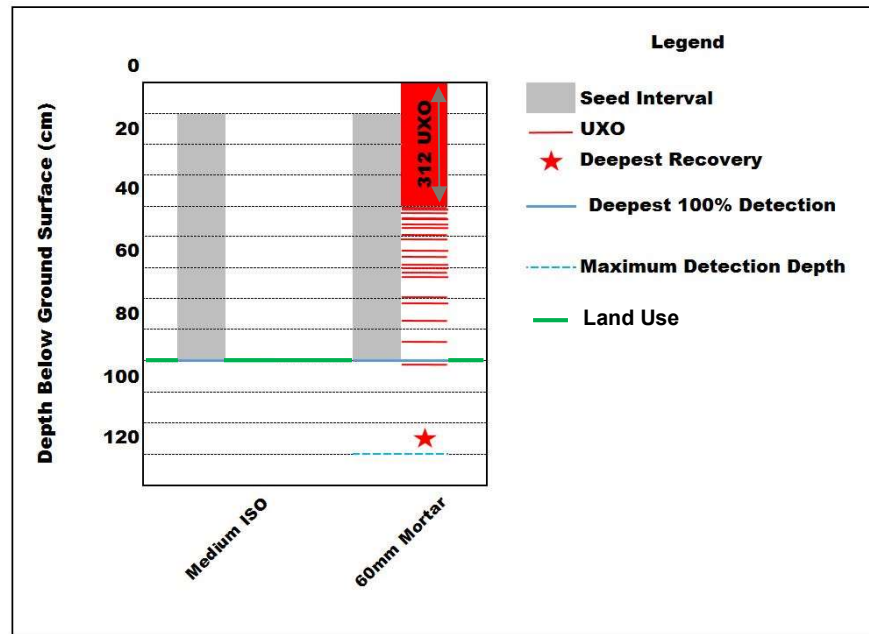

Figure B-11: Former Camp Wheeler - Anomaly Per Acre Concentration Map

US Army Corps  
of Engineers

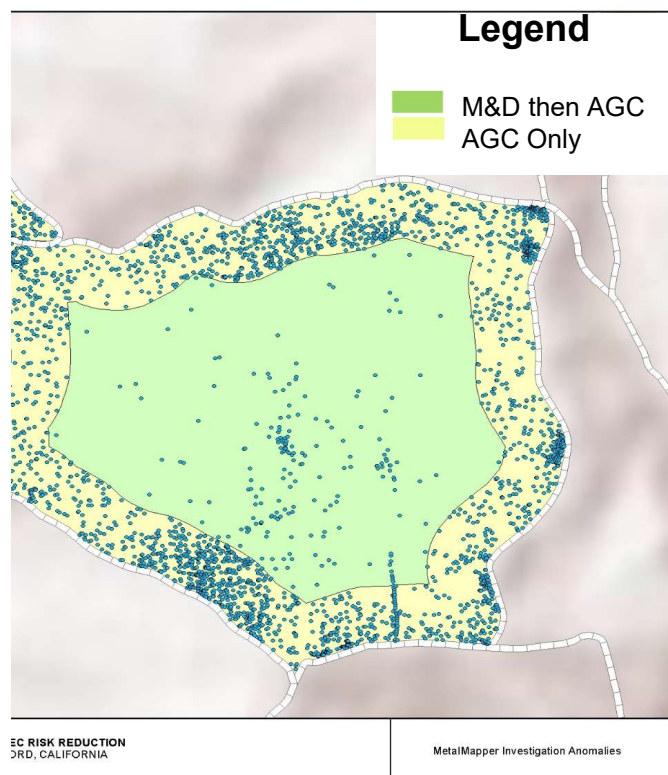

# “THIS IS WHAT WE ACHIEVED”

Two simple but critical elements:

1- Show where we looked for MEC

2- If at any time MEC was under\*  
the sensor, it was detected

$$V(t) = \mu_0 n_R n_T I_0 C_R \cdot C_T B(t)$$

*EMI Dipole Model*

TEMTADS 2x2 Sensor Response Curves for  
2 Variants of 37-mm Projectile

\*In the detectable range

## “HIGH DEGREE OF CONFIDENCE”

- In-Line Spacing ✓
- Across-Line Spacing ✓
- Coverage ✓
- Background Noise ✓
- Interference Sources ✓
- Tx Current ✓
- Rx Settings ✓
- Instrument Averaging Functions ✓
- Anomaly Selection Methodology ✓
- Positioning Accuracy ✓
- Anomaly Resolution ✓
- Inversion Model ✓
- Classification Match Metrics ✓

We can quantitatively QC each of these until we are blue in the face...

But what do people really want to know?

# HOW DEEP CAN YOU DETECT? WHAT DID YOU MISS?

## Before we embraced the EMI Dipole Model:

- Clean-up Statement (as explained by many in USACE between mid '90s to about 2010):
  - We didn't know what was there before we came
  - We recovered what we recovered
  - We don't know what we left behind
- Words commonly used
  - GPO
  - 10% QC sweep
  - 10% QA sweep
  - Failure is missing a piece of metal 37mm or longer in any dimension
  - The site will be cleared using a combination of geophysics and mag and flag
  - EE/CA, TCRA, NTCRA

## After we embraced the EMI Dipole Model:

- Clean-up Statement:
  - If MEC was there, and
  - the metal detector went over it, and
  - our system was working, then
  - ✓ We detected & recovered it
- Words Commonly Used:
  - DAGCAP
  - CERCLA Remedial Action
  - Remedial Action Objectives
  - QAPP
  - Horizontal CSM
  - Vertical CSM
  - QC Seeds
  - Validation Seeds

# FOCUS ON SEEDING

## Who Should Do It

• Current Guidance does not specify

• How Much Em 2001-15: Quality Requirements Tables 11-3 through 11-6

- Commonly thought as contractor “QC” & government “QA”
- Need to think
  - “Single Blind”
  - “Double Blind”

## SEEDING: WHEN

Two types of “When”:

1. The “Before Work Begins When”:

- Remedial Actions & Removal Actions: Always
- Remedial Investigations: Final Decisions → Always; Otherwise, not so much
- Feasibility Studies: For costing (i.e. analog)

2. The “After An Analog Validation Failure When”

Two schools of thought:

- i. Keep redoing the area until all seeds are recovered
- ii. Re-seed to maintain high degree of testing

# SEEDING: HOW MUCH

Digital Methods:  
Minimum 1 each  
QC and  
Validation per  
system per day

Analog Methods:  
5-6 Validation  
per system per  
day

Environmental Quality Tests And Their MMRP Quality Analogues

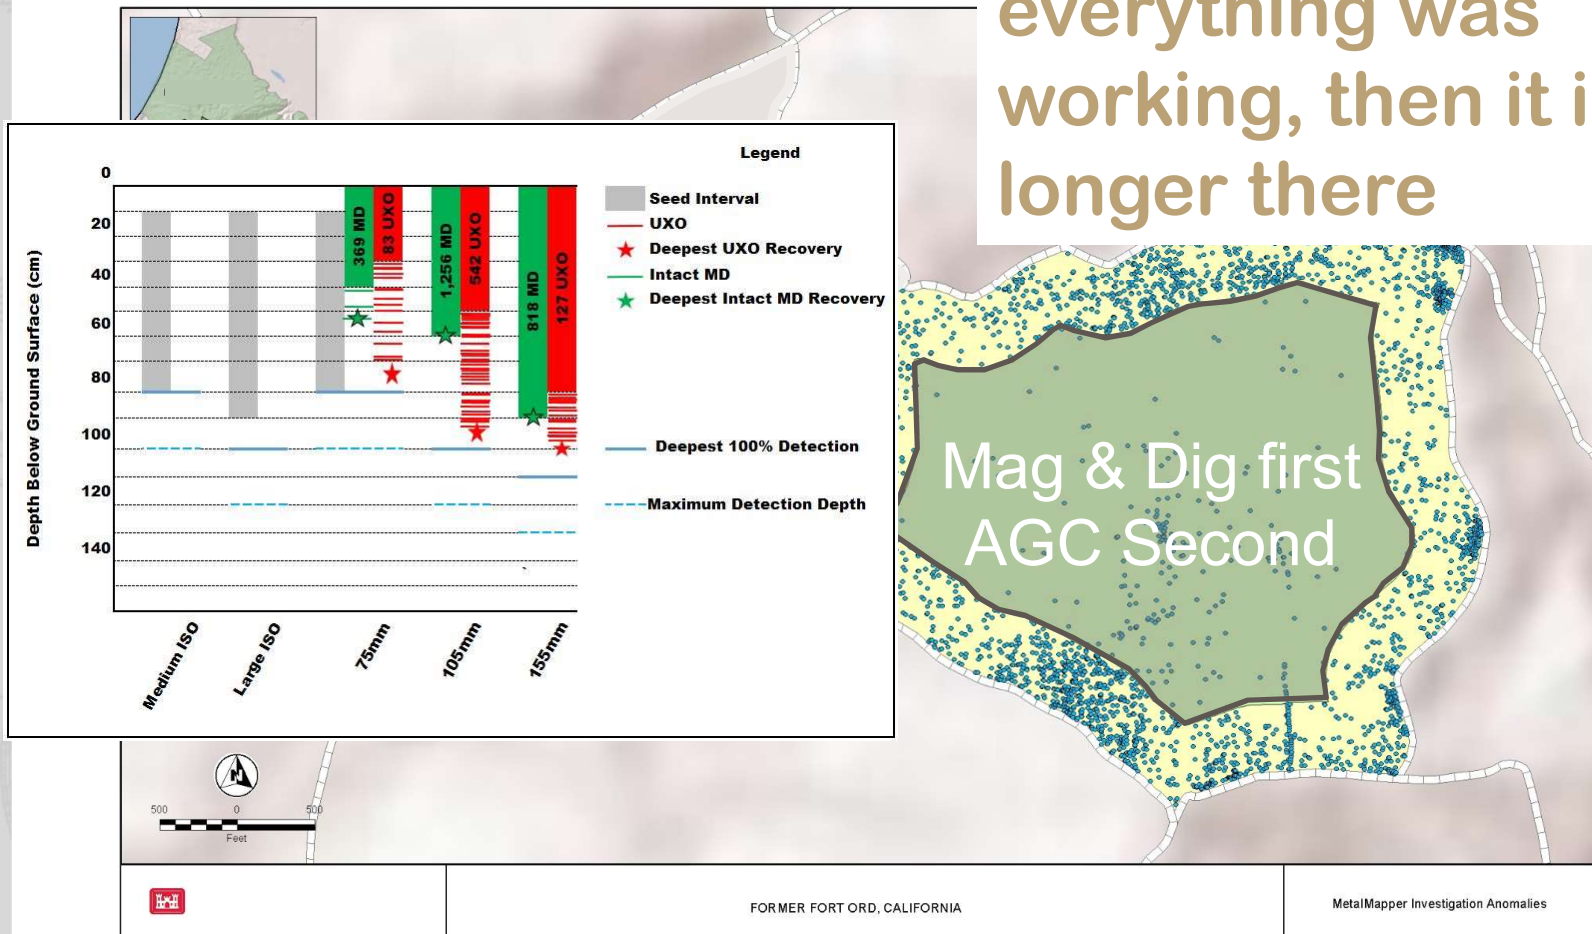

Environmental Chemistry Quality Test	Purpose	Blind Seeding Analogue	Purpose
<b>Performance Test Sample</b>	Assess capability to detect target analytes within acceptable criteria	<b>QA (Government) seeding</b>	Assess capability to detect MEC within acceptable depth intervals
<b>Matrix Spike</b>	Assess performance of the method to detect target analytes in the presence of interferences caused by the sample matrix	<b>Seeding in the presence of interference sources, such as nearby clutter, external noise, or variable background</b>	Assess performance of the detection method in the presence of interference sources
<b>Laboratory Control Sample</b>	Determine if the system is running properly	<b>QC (contractor) seeding</b>	Determine if the MEC detection and recovery system is running properly
<b>Laboratory Fortified Blank</b>	Evaluate sensitivity and bias to detect low concentrations (at the QL) of specific compounds	<b>Seeding at or near the maximum required reliable detection depth</b>	Assess ability to consistently detect deep MEC at the predicted reliable detection depth

# WHY ALL THIS SEEDING DATA USABILITY ASSESSMENT TO SUPPORT THIS:

## Vertical CSM & Coverage Map

→ If it was there, and everything was working, then it is no longer there

## SUMMARY

### GOAL OF ENVIRONMENTAL DATA QUALITY

Produce data appropriate for its intended use  
that is defensible and reproducible

We Can Do This:

- Based On Complete Knowledge Of System Performance
- Needs-Driven Design
- Quality Management Systems

*When The Music  
Stops, Grab A  
Seat*

The Consequence Of  
Environmental Data  
Quality
